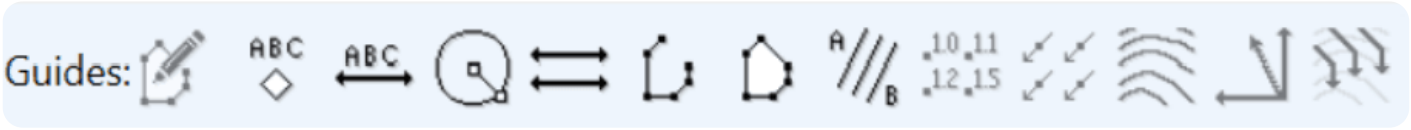
# Guides Tools - Overview



The ‘Guides’ layers allow extra information to be displayed on the field in the working area. This information can include elevation grids, flow directions, and contour lines.

There are many tools available in the guides toolbar to help manage and quantify the elevations on the field.

Guides can also be exported in control files for use in T3RRA in cab software (e.g. T3RRA Cutta) by dragging them into the export window. See more in Exporting a T3RRA Cutta (*.tci) Control File.
